

ABSTRACT

A liquid-cooled mold for the continuous casting of metals,
including mold plates made of copper or a copper alloy, which
are supported at their rear on supporting plates by the use of
5 a plurality of bolts. The bolts have bolt heads in the region
of the backsides of the supporting plates facing away from the
mold plates. Between the bolt heads and the supporting plate
an articulation system making possible relative motion between
the mold plate and the supporting plates is incorporated,
10 having two articulation members, between which a sliding
element is undetachably embedded.
